

What is claimed is:

- 09220'2259T660
1. A configurable software system that compares the usage characteristics of a  
5 computer file to a second data set, in order to associate data from the second set with said  
file.
  2. A configurable software system of claim 1, where the usage characteristics of a  
computer file include the date and time of operation.
  - 10 3. A configurable software system of claim 1, where the second set of data relates to  
a user's schedule or activities.
  4. A configurable software system of claim 1, where the data of the second set is  
15 obtained by interfacing with another software program, for example, a third party  
scheduling and planning software.
  5. A configurable software system of claim 1, where the association of data between  
the second set and said file is completed automatically, based on matching the date and  
20 time of current computer operation against a schedule of events with dates and times.
  6. A configurable software system of claim 1, where a folder structure is generated  
automatically according to characteristics from the second data set.
  - 25 7. A configurable software system of claim 1, where the computer user has the  
capability of manually entering additional data to be associated with said file.
  8. A configurable software system of claim 1, where data associated with said file  
30 resulting from such matching are stored in a searchable database, or other searchable data  
structure.

9. A process for associating scheduling data with a file consisting of the following acts: (A) stipulating a schedule of events with dates, times and activities; (B) using a computer, for example to create, modify, delete or access a current file; (C) comparing at least one characteristic of the current file against the schedule; (D) associating a searchable label to the current file when the current file matches at least one characteristic of the schedule; and (E) retrieving the current file using the label.
10. A configurable software system that embodies claim 9.
- 10 11. A process for associating scheduling data with a file consisting of the following steps: (A) interfacing with a scheduling or planning program to import a schedule of events with dates, times, activities, and related data; (B) using a computer, for example to create, modify, delete or access files; (C) comparing at least one characteristic of the current file against the schedule; (D) associating a searchable label to the current file when the current file matches at least one characteristic of the schedule; and (E) retrieving the current file using the label.
- 15 12. A configurable software system that embodies claim 11.
